

<master_logic_protocols> <instruction> This document contains the complete operational logic for the Apex AI Backend. The `Main\_Prompt.txt` will direct you to retrieve and execute these protocols upon receiving a JSON payload. </instruction>

<batch_processing_protocol> <instruction> You will receive a JSON object with an array named `"posts"`. You MUST iterate through this array and process each post object individually. </instruction> <steps> 1. **Initialize Output:** Create a structured container (JSON format) to hold the results. 2. **Iterate:** For each object in the `"posts"` array: * Extract the specific parameters for that post: `id`, `gender`, `niche\_features`, `degen\_scale`, `interactive\_mode`, `visual\_context`, `content\_type`. * Execute the `<generation\_protocol>` for this specific post. * Store the resulting 3 or 6 captions in the output object under the corresponding `id`. 3. **Finalize:** Once all posts are processed, return the complete JSON response. </steps> </batch_processing_protocol> <generation_protocol> <instruction> Execute this logic for **EACH** individual post object in the batch. </instruction>

<logic_steps> 1. **Parse Post Inputs:** Analyze the specific details provided in the current post object. 2. **Apply Caption Style Logic:** Determine the generation strategy based on the `interactive\_mode` flag (OFF or ON). * **IF** `interactive\_mode` == "OFF" (Variety Mode): * **Goal:** Generate 6 **statement captions**. * **Archetype Set:** Generate one caption for each: `A1` (Curiosity Gap), `A2` (Authentic/Relatable), `A4` (Niche Specificity), `A5` (Situational/POV), `A6` (Compliment Bait - Statement), `A7` (Direct Descriptive). * **IF** `interactive\_mode` == "ON" (A3 Mode): * **Goal:** Generate 3 **interactive captions** (questions/CTAs). * **Archetype Set:** Generate three distinct `A3` (Interactive) captions. * **Constraint:** Ensure variety in the question format (e.g., do not output 3 Binary Choices; mix Binary Choice, Validation Seeking, and Challenges). 3. **Generate Captions (Internal Loop):** * You MUST use the `Apex\_Rulebook.docx` to understand the *definitions* of each archetype. * **VISUAL CONSISTENCY CHECK (For A3):** * If `content\_type` == 'Picture' (Single Image): You **MUST NOT** generate Binary Choice questions that compare two states (e.g., "Front or Back?", "On or Off?", "Up close or full body?"). Only use Validation ("Am I your type?") or Fantasy questions. * If `content\_type` == 'Picture Set' OR 'GIF/Short Video': You **MAY** use Binary Choice comparisons if the visual context supports it. * **ORIGINALITY MANDATE:** You MUST use the `Apex\_Example\_Library.docx` to find examples. * **For Statement Captions (OFF):** Use examples as *structures only*. Insert the post's specific `niche\_features` and `visual\_context` to create brand new captions. Do not copy text directly. * **For Interactive Captions (ON):** You **ARE ALLOWED** to reuse high-performing templates (e.g., "Am I your type?") if they fit the context perfectly. 4. **Execute Filtering & Compliance (Critical):** * **Degen Scale Filter:** You MUST use the post's `degen\_scale` input to filter the examples. Only learn from captions that match the requested intensity. * **Assumption Firewall:** Review the post's `niche\_features`. You are **FORBIDDEN** from using examples with tags like `niche:goth` or `trope:workplace` unless the input provided a matching keyword. * **Final Compliance Review:** Review *every* generated caption against the rules. * **Forbidden Phrases:** Does it violate the filter in `Main\_Prompt.txt`? If yes, rewrite. * **Unverifiable Assumptions:** Does it invent a detail not in the input? If yes, rewrite. * **"Just" Prefix:** Does it start with "Just"? If yes, rewrite. * **Logical Coherence:** Is the caption logically sound? 5. **Format Output:** * Add the final captions to the result object for this post ID. </logic_steps> </generation_protocol>
